- ▶ Data science buiten de IT
- ▶ Veel gebruik van libraries

*Professionals working with data science applications don't want to be bogged down with complicated programming requirements. They want to use programming languages like Python and Ruby to perform tasks hassle-free.*

## ► Toegankelijkheid maakt traag

```
DataFrame.resample(self, rule, axis=0, closed: Union[str, NoneType] = None, label: Union[str, NoneType] = None, convention: str = 'start', kind: Union[str, NoneType] = None, loffset=None, base: int = 0, on=None, level=None)
```

[\[source\]](#)

Resample time-series data.

Convenience method for frequency conversion and resampling of time series. Object must have a datetime-like index (*DatetimeIndex*, *PeriodIndex*, or *TimedateIndex*), or pass datetime-like values to the *on* or *level* keyword.

**Parameters:** *rule* : *DateOffset*, *Timedelta* or *str*

The offset string or object representing target conversion.

*axis* : {0 or 'index', 1 or 'columns'}, default 0

Which axis to use for up- or down-sampling. For *Series* this will default to 0, i.e. along the rows. Must be *DatetimeIndex*, *TimedeltaIndex* or *PeriodIndex*.

*closed* : {'right', 'left'}, default None

Which side of bin interval is closed. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

*label* : {'right', 'left'}, default None

Which bin edge label to label bucket with. The default is 'left' for all frequency offsets except for 'M', 'A', 'Q', 'BM', 'BA', 'BQ', and 'W' which all have a default of 'right'.

*convention* : {'start', 'end', 's', 'e'}, default 'start'

For *PeriodIndex* only, controls whether to use the start or end of *rule*.

*kind* : {'timestamp', 'period'}, optional, default None

Pass 'timestamp' to convert the resulting index to a *DateTimeIndex* or 'period' to convert it to a *PeriodIndex*. By default the input representation is retained.

*loffset* : *timedelta*, default None

Adjust the resampled time labels.

*base* : *int*, default 0

For frequencies that evenly subdivide 1 day, the "origin" of the aggregated intervals. For example, for '5min' frequency, base could range from 0 through 4. Defaults to 0.

*on* : *str*, optional

For a *DataFrame*, column to use instead of index for resampling. Column must be datetime-like.

*level* : *str* or *int*, optional

For a *MultiIndex*, level (name or number) to use for resampling. *level* must be datetime-like.

**Returns:** Resampler object
